

VOICE RECORDING SOLUTION (VRS)

In the event of an incident, having the ability to review radio conversations can be invaluable. Our Voice Recording Solution (VRS) has been designed to capture and securely store all radio transmissions, ensuring critical communication is never lost. With its compact, plug-and-play design, the system requires no external software, making setup quick and hassle-free.

The VRS also offers real-time remote listening and monitoring through a PC or mobile device, and includes functionality to transcribe conversations for accurate record-keeping and analysis.

Access to Recordings: Users connect directly to the recorder via a secure Wi-Fi network. Recordings are accessed through a browser-based interface—no software installation required. Each transmission is indexed by time, channel, and radio ID, with the player automatically linking transmissions to recreate the full conversation.

Secure Storage: All recordings are stored locally on the unit in an encrypted format. Access is password-protected via the web interface, and only users connected to the dedicated Wi-Fi network can log in. Data can be easily exported and backed up when required.

Clear Audio Quality: Built-in noise reduction and suppression technology deliver clear recordings, even in noisy environments. While not post-production software, the system ensures excellent audio clarity suitable for review and analysis.

Simple Setup: The system is designed for plug-and-play use. Once configured by our engineers, the unit records automatically with no additional software required.

Easy Export: Recordings can be exported by selecting a date and time range, generating a ZIP file with an offline playback interface—ideal for incident investigations or audits.

Scalable Solution: The modular system can be scaled to record as many channels as needed, making it adaptable for projects of all sizes.
