Other options available as tailored solutions.

A freestanding support frame allows fast and flexible changes in a production line's layout. It's perfect for spaces where the ceiling construction can't carry the crane load. It also enables free usage of a bridge crane operating in the same hall. A freestanding support frame is classified as suspension and not a part of the building.

Specifically designed to handle effortless and precise load movements, the freestanding support frame is easy to install and helps to optimise the working area and improve productivity.
